MPS2301	MATHEMATICAL PHYSICS - I	Category	L	T	P	Credit
			88	2	-	4

Preamble

The aim of this course is to provide the mathematical foundation in vectors, matrices, Complex numbers and special functions required for the description of the physical phenomena.

Prerequisite

- Basic idea on vectors, matrices , complex numbers, Partial Differential Equations , Special Functions

Course Learning Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO 1	Understand the basic principles of mathematical physics and its applications	K2
CLO 2	Analyse the nature of the problems in physics	K3
CLO 3	To improve their logical, mathematical and analytical skills in problem solving	K4
CLO 4	Formulate, interpret and draw inferences from mathematical solutions	K5
CLO 5	Develop expertise in mathematical techniques required in physics	K6

Syllabus

Unit I – Vectors **17 Hrs**

Gauss divergence theorem[1]& its physical interpretation - Gauss's Theorem – Stokes's theorem- Poisson's equations – curvilinear coordinates – orthogonal curvilinear coordinates – condition for orthogonality – **cylindrical coordinates**[2] – spherical polar coordinates. linear vector space, linear independence of vectors and dimensions, basis and expansion theorem, inner product and unitary spaces, Orthonormal sets, Schmidt's orthogonalisation method.

Unit II – Matrices **17 Hrs**

Review of algebraic operations of matrices, sub matrices[3], partitioning of matrices, **special types of matrices and their properties**, **vectors as matrices**[4] and vector spaces, linear transformations, orthogonal and unitary transformation, eigen values, eigen vectors, Cayley Hamilton theorem, **Stochastic matrices, diagonalisation of matrices**, **power of a matrix**, **exponential of a matrix**[5]. Matrices in physics: rotation matrix, Pauli's spins matrices, Dirac matrices.

Unit III – Complex Variables **18 Hrs**

Introduction, **regular functions, elementary functions and mapping,** contour integration, Cauchy's theorem, Cauchy's integral formula, Results based on contour formula, **Taylor's expansion**[7], Laurent's expansion, Residue and contour integration, Cauchy's residue theorem, integration round the unit circle, evaluation of definite integrals - $\sin\theta$ and $\cos\theta$.

Unit IV – Partial Differential Equations **18 Hrs**

Laplace equation, Poisson's equation, Heat flow equation, Wave equation, Helmholtz equation, Solution of Laplace equation in Cartesian co-ordinates, in two dimensional cylindrical co-ordinates, in two dimensional spherical polar co-ordinates, Solution of Poisson equation, **Diffusion equation or equation of heat flow. Solution of heat flow equation in one dimension**[8,9]**.**

Unit V – Special Functions **18 Hrs**

Series solution,**solution of Linear differential equation of first order**[10], solution of second order linear differential equation with constant coefficients, power series solution- Frobenius' method, Legendre's equation, Legendre's function of I and II kind, Generating function of Legendre polynomial, Recurrence formula for $P_n(x)$, Bessel's function of I kind, recurrence function for $J_n(x)$, generating function for $J_n(x)$, Hermite differential equation, **Hermite polynomial, recurrence for Hermite polynomial**[11]**.**

MPS2302	CLASSICAL MECHANICS	Category	L	T	P	Credit
			88	2	-	4

Preamble

The aim of this course is to provide an in-depth knowledge of the principles of classical mechanics and the study of specific problems, viz. the two body central force problem and small oscillations.

Prerequisite

- Basic knowledge on differential calculus and Newtonian Mechanics
- Knowledge on rotational dynamics

Course Outcomes

CLO Number	CLO Statement	Knowledge Level
CLO1	Study the applications of Newtonian mechanics in daily life	K2
CLO2	Understand the motion of bodies, including the special case in which bodies remain at rest in accordance with the Newtonian principles	K3
CLO3	Analyze the movement of macroscopic objects, like projectiles, and astronomical objects, such as spacecraft, planets, stars, and galaxies.	K4
CLO4	Develop knowledge of the behaviour of bodies under the influence of forces	K5
CLO5	Develop familiarity with the physical concepts and facilitate with the mathematical methods of classical mechanics	K6

On the successful completion of the course, students will be able to

Mapping with Programme Outcomes

CLO4	S	M	M	M	M	S	L
CLO5	S	M	M	S	M	M	L

S- Strong; M- Medium; L-Low

Syllabus

Unit I: Fundamental principles of Lagrangian Formulation 17hrs

Mechanics of a particle- Mechanics of a system of particles- constraints- D'Alembert's principle and Lagrange's equations- Velocity – dependent potentials and the dissipation function- **simple**

application of the Lagrangian formulation[1]-Single particle in space-**Atwood's machine**[2,3]**-bead sliding on a rotating wire**[3,4], linear harmonic oscillator- **simple pendulum**[5].

Unit II: Variational principles andLagrange's equations: **17 hrs**

Hamilton's principle- some techniques of the calculus of variations- derivation of Lagrange's equations from Hamilton's Principle- Extension of Hamilton's principle to non holonomic systems- **Advantages of a variational principle formulation**[6] - conservation theorems and symmetry properties- Energy function and the conservation of energy.

Unit III: Two body central force problem **18 hrs**

Reduction to the equivalent one-body problem- the equations of motion and first integrals-the equivalent one- dimensional problem and classification of orbits- law potentials- conditions for closed orbits (Bertrand's theorem) - **the Kepler problem: inverse square law of force**[7]**- the motion in time in the Kepler problem**[7]- The Laplace-Runge-Lenz vector-Scattering in a central force field- **transformation of the scattering problem to laboratory coordinates**[8]**.**

Unit IV: Small oscillations **17 hrs**

Formulation of the problem - Eigen value equation and the principle axis transformation- frequencies of free vibrations- normal coordinates- **Free vibrations of a linear tri atomic molecule**[9] **- Forced vibration and the effect of dissipative forces**[10]**.**

Unit V: Hamilton's Formulation **18 hrs**

Legendre transformations and the Hamilton canonical equations of motion –**Cyclic coordinates**[11,12] - Routh's procedure- Hamiltonian formulation of relativistic mechanics-**Derivation of Hamilton's equations from a variational principle**[13]- The principle of least action.

Poisson Brackets-definition-**invariance of Poisson- brackets with respect to canonical transformation**[14] –Equations of motion in Poisson bracket form-**Jacobi's identity**[14]-infinitesimal contact transformations-interpretation in terms of Poisson brackets-The angular momentum and Poisson brackets.

MPS2303	THERMODYNAMICS AND STATISTICAL MECHANICS	Category	L	T	P	Credit
			88	2	-	4

Preamble

To acquire a sound understanding of the basic principles of statistical mechanics and its application to realistic problems

Prerequisite

- An idea on thermodynamical variables, quantum and classical statistics

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowldge Level
CLO1	Learn relationship between equilibrium distributions and kinetic processes leading to equilibrium	K2
CLO2	Apply classical and quantum distributions in circumstances varying from standard examples to real statistical problems	K3
CLO3	Become aware of the richness and complexity of statistical behaviour exhibited by interacting systems and various approaches (phenomenological and microscopic) developed to comprehend such systems	K4
CLO4	Examine appropriate limiting behaviours in various statistical systems and to develop statistical description of system	K5
CLO5	Construct a partition function for a system in thermal equilibrium and use it to obtain thermodynamic quantities of interest.	K6

CLO4	S	S	M	S	S	S	L
CLO5	S	S	S	S	S	L	S

S- Strong; M-Medium; L-Low

Syllabus

Unit – I: Thermodynamics **18 hrs**

Thermodynamic variables[1]- extensive and intensive variables- **Zeroth law of thermodynamics**[2] - equivalence of heat and work - **first law of thermodynamics**[3,4] - Significance of the first law of thermodynamics - thermodynamic processes - reversible process – irreversible process - state variables and process variables - **definition of entropy**[5] **- second law of thermodynamics**[6,7] - entropy changes in irreversible processes - Maxwell's Thermodynamical relations - thermodynamic potentials – **Enthalpy**[8]**,** Helmholtz and the Gibbs functions- Phase transitions – Clausius - Clapeyron equation – van der waals equation of state.

Unit- II: Classical Statistics - I **18 hrs**

Macroscopic and microscopic states[9] **-** phase space - Volume in phase space - postulate of equal a priori probability - density distribution in phase space - Liouville's theorem, Maxwell-Boltzmann distribution law - **micro-canonical ensemble**[10, 11] **- canonical ensemble**[10, 11]- calculation of mean values and fluctuations in a canonical ensemble - fluctuation dissipation relation - energy fluctuations and heat capacity - Grand-canonical ensemble - fluctuations in number of particles.

Unit – III: Classical Statistics - II **17 hrs**

Classical partition functions and their properties - Calculations of thermodynamic quantities - Chemical potential - Ideal mono atomic gas - entropy of mixing - Gibbs paradox – Equipartition theorem and its simple applications.i) Mean kinetic energy of a molecule in a gas ii) **Brownian motion**[12] iii) **Harmonic Oscillator**[13] iv) Specific heat of solid. Maxwell velocity distribution, Doppler Broadening of Spectral lines**.**

Unit – IV: Quantum Statistical Mechanics – I **17 hrs**

Ideal Bose systems

Symmetric and antisymmetric wavefunctions – The density matrix - **Quantum harmonic oscillator**[14] - Einstein's theory of heat capacity - Debye's theory of heat capacity - Bose – Einstein statistics - **black body radiation**[15]- photon gas - Planck's law - Bose-Einstein Condensation - lambda transition – Liquid helium – **Super fluidity**[16,17]

Unit-V: Quantum Statistical Mechanics - II **18 hrs**

Fermi-Dirac statistics[18] **- Fermi distribution**[18] **- Fermi energy**[18] - Mean energy of Fermions at absolute zero - Fermi energy as a function of temperature - electrons in metals - Electronic specific heat - **White Dwarfs**[19]- Compressibility of Fermi gas - Pauli's para magnetism - A relativistic degenerate electron gas.

MPS2304	ELECTRONICS	Category	L	T	P	Credit
			88	2	-	4

Preamble

This course deals with semiconductor device characteristics, Op-Amp characteristics and their applications& digital principles

Prerequisite

- Basic idea on semiconductor devices
- Concepts of amplifiers and oscillators

Course Learning Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand the concepts of semiconductor devices.	K2
CLO2	Design counters and to explain power devices and their application in various fields	K3
CLO3	apply the concepts of operational amplifier to solve differential and simultaneous equations.	K4
CLO4	Solve problem related to semiconductor devices and oscillator circuit Familiarize the conversion of data from Analog to Digital and Digital to Analog	K5
CLO5	Take projects in electronics relevant to industrial and R &D needs	K6

S- Strong; M-Medium; L-Low

Syllabus

Unit I : Electronic Circuits and Devices I: 18 hrs

Tunnel Diode- Structure-Characteristics- **applications[1]** - IMPATT- PNPN diodes characteristics &**applications[2]** – Gunn diode- device operation-negative differential resistance, SCR-characteristics &**applications[3]**, Silicon Controlled Switch(SCS) – UJT structure & characteristics - UJT Oscillator - **Applications of UJT[4]**.

Optoelectronics: Photo Resistor-Photo Diode - Photo Transistor, LEDs- Device structure and **Working principle[5].**

Unit II: Electronic Circuits and Devices II: 18 hrs

The junction field effect transistor- **the pinch off voltage[6]** (Vp)-the JFET volt-ampere characteristics- Biasing the FET- FET as a Voltage Variable Resistor - the FET small signal model- the common source Amplifier at low & High Frequencies - common Drain amplifier at low & High Frequencies - MOS structure and principle of operation – **current voltage characteristics[7]**. Logic gates using MOSFETs – Complementary MOSFETs.

Unit III : Operational Amplifier: 17 hrs

The operational amplifier - parameters of op amps, Frequency Response of an amplifier**, the comparator[8]**, Basic Operational Amplifier applications-Differential DC amplifier- integrator and differentiator-Electronic analog Computation solving Simultaneous and Differential equations- **log and Exponential amplifiers[9].**

Unit IV : Oscillators and Data Converters 17hrs

Wave Form Generators and Wave Shaping Circuits using Op amps – Phase Shift-Oscillator-Wien Bridge Oscillator-Crystal Oscillator- Multivibrators- Schmitt Trigger- Triangular Wave Generators – Pulse Generators - the weighted resistor D/A convertor- The R-2R ladder D/A converter – **Switches for D/A converters[10]- Inverted ladder D/A converter[11]-** A/D converters- A counter type- successive Approximation converters. IC 555 Timer and its **Applications[12].**

Unit V : Registers and Counters 18 hrs

The shift register, Serial in –Serial out, Serial in – Parallel out, **Parallel in – Serial out[13]**, Parallel in – Parallel out – Counters, methods to improve counter speed,- Mod-3 counters, Mod 5, Mod 7, Mod 9 and **decade counters[14]**, Ripple counter, the up-down ripple counter, the up-down synchronous counter, ring counters, **sequence generator[15]**.

MPS23P1	PRACTICAL I - GENERAL PRACTICALS	Category	L	T	P	Credit
			-	-	4	4

Preamble

The aim of this course is to make the students gain a practical knowledge in the basics of Physics.

Prerequisite

- Basic experience in handling devices/instruments (UG level)

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CO Statement	Knowledge Level
CLO1	Understand the basics of experimental physics	K2
CLO2	Explore the concepts involved in the thermodynamics, heat and modern optics	K3
CLO3	Acquire strong laboratory skills	K4
CLO4	Enhance the skill to meet the present day requirements in industries, research fields	K5
CLO5	Create the knowledge of theories involved in physics using practical experiments	K6

S- Strong; M-Medium; L-Low

Syllabus

PRACTICAL I - GENERAL PHYSICS

(Examination at the end of Second Semester)
Any Twelve Experiments

1. Young's Modulus-Elliptical Fringes
2. Young's Modulus-Hyperbolic Fringes
3. Viscosity of a Liquid-Mayer's Oscillating Disc
4. Determination of
   (i) Refractive Index of transparent solids and liquids using Laser source
   (ii) Particle size (iii) Diffraction at a circular aperture (pin hole)
5. Study of characteristics of Laser
   (i) Determination of Gaussian nature of laser source and evaluation of beam spot size.
   (ii) Measurement of Laser beam divergence (iii) Absorption of light on various filters
6. Electronic Specific Charge - 'e/m' by Thomson's Method
7. Thermistor -Temperature Coefficient and Band Gap Energy
8. Magnetic Hysteresis loop tracing
9. Study of characteristics of optical fibre –

(i) Numerical aperture (ii) bending losses (iii) splice losses (iv) attenuation by fibre cut –Back method

10. Determination of Curie Temperature of Ferro electric solid
11. Characteristic study of Photo Transistor, photodiode and photovoltaic cell (solar cell)
12. Determination of critical potential by Frank Hertz experimental method.
13. Thickness of Wire by Air Wedge Diffraction
14. Determination of dipole moment of a liquid
15. Identification of prominent lines – Copper arc
16. Characteristic study of LED, LDR and Opto coupler.

Course Designers:

1. Dr. N.Priyadharsini

MPS23P2	PRACTICAL II-ELECTRONICS PRACTICALS	Category	L	T	P	Credit
			-	-	4	4

Preammble

The aim of this course is to make the students to practically learn the characteristics of different electronic circuits.

Prerequisites

- Basic experience in constructing and handling electronic circuits (UG level)

Course Outcomes

On the successful completion of the course, students will be able to

Mapping with

CLO Number	CO Statement	Knowledge Level

S- Strong; M-Medium; L-Low

Syllabus

PRACTICAL II-ELECTRONICS PRACTICALS
(Examination at the end of second Semester)
Any Twelve Experiments

1. Design of Regulated and Dual Power Supply and Construction using fixed voltage regulator and 723.
2. Characteristics of UJT
3. UJT Relaxation Oscillator
4. FET –common source amplifier
5. FET –common drain amplifier
6. Op-Amp parameters
7. Wave Form Generators- using Op-Amp and Timer 555.
8. (i) Phase-Shift Oscillator (ii) Wien's Bridge Oscillator using Op-Amp
9. Op-Amp – log and antilog amplifier
10. Sign Changer, Scale Changer, Summer and Subtractor- Op-Amp
11. Analog Computer Setup-Solving Simultaneous Equations
12. Schmitt Trigger using discrete components and OP-AMP/ Timer 555

By Simulation and using ICs

13. Flip-Flops (RS, JK , D)
14. Counters- Digital ICs
15. Shift register- Digital ICs
16. (i) Write a C program to calculate the De Broglie's wave length $\left(\lambda = \frac{h}{p}\right)$

    (ii) Write a C program to prove Heisenberg's Uncertainty Principle
17. Write a C program to find the solution for the ground state of hydrogen atom
18. Write a C program to integrate a given function using Simpsons Rule.
19. Write a C program to study the Motion of a particle under the force f(x) = -x
20. Write a C program to calculate the bond length of NaCl

		Category	L	T	P	Credits
MPS2305	**MATHEMATICAL PHYSICS-II**		73	2	-	5

Preamble

This course aims at the introduction of advanced mathematical tools such as transforms, probability distribution and group theory.

Prerequisite

- Basic Idea on Series and transforms, probability

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand the basic theories and formulas in solving the physical problems.	K2
CLO2	Applications include boundary value problems in electrodynamics and diffusion, eigen value problems in quantum mechanics, and Green's function methods for scattering.	K3
CLO3	Analyse the nature of the problem	K4
CLO4	Capable of evaluating problem at higher order levels using advanced mathematical tools	K5
CLO5	Enhances the mathematical implementation in physics.	K6

S- Strong; M-Medium; L-Low

Syllabus

Unit I – Fourier Series And Transform **15 Hrs**

Evaluation of the coefficients of Fourier series[1,2], Dirichlet's theorem, Dirichlet's condition,

Half range series, change of interval, Fourier series in the interval (0 to T) and uses of Fourier series. Applications Half and full wave rectifier. **Properties of Fourier series[3]**, Gibb's phenomen on, Parseval's identity of Fourier series, Fourier sine and cosine transforms of derivatives.

Unit II – Laplace Transform **14 Hrs**

Properties of Laplace transforms[4,5], Laplace transform of the derivative of a function,Laplace transform of integral, Laplace transform of periodic functions, Invers e Laplace transform , properties, Faltung theorem, Evaluation of inverse Laplace transform by convolution theorem, applications of Laplace transform.

Unit III – Dirac Delta Function and Green's Function **15 Hrs**

Dirac delta function, properties, Fourier transform of delta function, Laplace transform ofdelta function, derivative of delta function, completeness condition in terms of Dirac delta function, three dimensional Dirac delta function.

Green's function for one dimensional case, general proof of symmetry property of Green's function, Eigen function, Green's function for Poisson's equation and solution of Poisson's equation.

Unit IV – Probability **14 Hrs**

Mathematical definition of priori probability[6], sample space[7], mutually exclusive events [8], theorem of total probability[8], compound events and theorems of compound probability, binomial and multinomial theorem of probability, Laplace-de-Moivre limit theorem, Measures of central tendency, measures of dispersion, Karl Pearson's coefficient of correlation, standard deviation. Theoretical distribution- Binomial, Poisson and Normal distribution.

Unit V – Group Theory **15 Hrs**

Concept of a group, abelian group, generation of finite group, cyclic group, group multiplication table [9,10], rearrangement theorem, subgroups, cosets, conjugate elements and classes, product ofclasses, complexes, Isomorphism, homomorphism, permutation groups, Cayley's theor em, representation of groups square and triangle only, reducible and irreducible representations, orthogon ality theorem

MPS2306	QUANTUM MECHANICS-I	Category	L	T	P	Credits
			73	2	-	5

Preamble

The aim of this course is to build a strong base on the basic facts of quantum mechanics and to make students understand the methods that are required for the accurate description of various microscopic systems.

Prerequisite

- Fundamental knowledge on classical mechanics
- Basic idea on operators and wave equations

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand the central concepts and basic formalisms of quantum mechanics; and the set of mathematical tools needed to formulate problems in quantum mechanics.	K2
CLO2	Solve problems in one, two and three dimensions, such as barrier potentials, harmonic oscillator, rigid molecule, hydrogen atom etc., and on systems of identical particles, e.g. determine the symmetry properties of the wave function, and the total spin.	K3
CLO3	Establishing the relations and validating various results. Inspecting on the quantum effects on various spectra. Comparing the properties of various quantities, methods and so on. Give concise physical interpretations, and arguments for the validity of the methods.	K4
CLO4	Integrate several components of the course like quantum states, symmetries, angular momentum etc in the context of finding solution to the problems in atomic and molecular physics	K5
CLO5	Present the tools, methodologies, language and conventions of quantum mechanics from this course to prove and test ideas and explanations on various problems involving many body systems.	K6

S- Strong; M-Medium; L-Low

Syllabus

Unit I **15hrs**

General formalism of quantum mechanics: Linear Vector Space[1]- Linear Operator- **Eigen Functions and Eigen Values[2]**- Hermitian Operator- Postulates of Quantum Mechanics- Simultaneous Measurability of Observables- General Uncertainty Relation- Dirac's Notation- **Equations of Motion; Schrodinger[3]**, Heisenberg and Dirac representation- momentum representation.

Unit II **14 hrs**

Energy Eigen value problems Particle in a box – **Linear Harmonic oscillator[4]**- Tunnelling through a barrier- particle moving in a spherically symmetric potential- System of two interacting particles-**Rigid rotator[5]- Hydrogen atom[6]**

Unit III **15 hrs**

Angular Momentum Orbital Angular Momentum-Spin Angular Momentum-**Total Angular Momentum Operators[7]-Commutation Relations of Total Angular Momentum with Components[8]**- Ladder operators-Commutation Relation of Jz with J+ and J- - Eigen values of J^2, Jz- Matrix representation of J2, Jz, J+ and J- - Addition of angular momenta- Clebsch Gordon Coefficients – Properties.

Unit IV **15 hrs**

Approximate Methods: Time Independent Perturbation Theory in Non-Degenerate Case- Ground State of Helium Atom-Degenerate Case-**First order perturbation theory for Degenerate level[9]-Stark Effect in Hydrogen**[10] – **Spin-orbit interaction**[11]-Variation Method & its Application to Hydrogen Molecule- WKB Approximation.

Unit V **14 hrs**

Many Electron Atoms Indistinguishable particles – Pauli principle- Inclusion of spin – spin functions for two-electrons- **The Helium Atom[13]** – Central Field Approximation - **Thomas-Fermi model of the Atom**[14] - Hartree Equation - Hartree-Fock equation.

MPS2307	ELECTROMAGNETIC THEORY	Category	L	T	P	Credits
			73	2	-	5

preamble

Students will develop a physical understanding of electromagnetic fields and waves to unify their understanding of electricity and magnetism

Prerequisite

- Undergraduate-level course in electricity and magnetism
- Mathematical methods

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Summarize the fundamentals of Electrostatics and Magnetostatics	K2
CLO2	Analyse the concept of Electrodynamic fields	K3
CLO3	Apply the concept of electromagnetic theory in electromagnetic waves	K4
CLO4	Understand the transverse behaviour of electromagnetic waves in different geometrics of wave guides	K5
CLO5	Formulate electromagnetic wave equations for different propagating media and to determine the flow of energy and wave velocity	K6

CLO5	S	S	S	L	S	L	L

S- Strong; M-Medium; L-Low

Syllabus

Unit I: Electrostatics and Magnetostatics **14 Hrs**

Coulomb's Law[1],Gauss's Law and applications[2],potentialfunction,field due to a continuous distribution of charge, equi-potential surfaces, **Poison's equation[3], Laplace's equation[4],**methodof electrical images-spherical conductor when earthed, insulated conducting sphere near a point charge capacitance, electro-static energy, boundary value problems with dielectrics, the electro-static uniqueness theorem for field of a charge distribution

Unit II: Magnetostatics **14 Hrs**

Lorentz force, electric current-**Ampere's law and applications[5]**-Long straight wire, Circular coil, Solenoid, Ampere's law for a current element -Ampere's law in differential vector form - **Biot-Savart law**[6], Magnetic scalar potential– Importance – Applications – magnetic dipole, Circular coil and Vector potential – Importance - Applications- Magnetic dipole, Long current carrying wire, equation of continuity-magnetization

Unit III: Applied Electromagnetic Waves **15Hrs**

Equationofcontinuityfortimevaryingfields–inconsistencyofampere'slaw- **Maxwell's equations – derivations[7]** – electromagnetic waves in free space – uniform plane wave propagation and its characteristics –wave equations for conducting medium–**Maxwell's equation in phasor form[8]** – wave propagation in lossless, conducting and dielectric media – depth of penetration

Unit IV: Electromagnetic Waves in Bounded Media & Power Flow **15 Hrs**

Poynting's theorem - statement and proof[9] – Interpretation of Poynting's vector – Power flow for a plane wave – power flow in a concentric cable and conductor having resistance –Instantaneous, average and complex Poynting vector – power loss in a plane conductor and a resonator -Boundary conditions – proof – reflection of plane waves by a perfect conductor for normal and oblique incidence – reflection of plane waves by a perfect dielectric for normal and oblique incidence– **Brewster's angle[10]**.

Unit V: Guided Waves and Wave Guides **15 Hrs**

Wavesbetweenparallelplanes–Transverseelectricwaves-Transversemagneticwavescharacteristics of TE and TM waves–Transverse electromagnetic waves–Attenuation in parallel plane guides – **attenuation for TE waves, TM waves and TEM waves[11]** – Rectangular guides – Transverse magnetic waves and Transverse electric waves in rectangular guides – Field configurations for dominant TM and TE modes - **Impossibility of TEM wave in wave guides[12]** –Transmission line analogy for waveguides- Q factor of wave guides.

MPS23CE	COURSERA - PYTHON FOR DATA SCIENCE AND ARTIFICIAL INTELLIGENCE	Category	L	T	P	Credits
			60			3

Preamble

The objective of introducing this paper is to give the students a working knowledge of the most popular and widely used programming languages of modern days, namely 'Python' language.

- **Python for Data Science , AI and Development (17hrs)**

  Python basics- Python Data Structures- Python Programming Fundamentals-Working with Data in Python- APIs, and Data Collection

- **Introduction to Artificial Intelligence (9 hrs)**

  AI and its Applications- AI concepts, Terminology and application areas- Issues , concerns and Ethical Considerations- The future with Ai and Ai in Action

- **Tools for Data Science (16hrs)**

  Overview of Data Science Tools-Languages of Data Science-Packages, APIs, Datasets and Models-Jupyter Notebooks and JupyterLab-RStudio & GitHub-Create and Share your Jupyter Notebook- IBM Watson Studio

- **Python Programming Essentials (10hrs)**

  Python as a Calculator-Functions-Logic and Conditionals-Python Modules

- **Python Basics : Selection and Iteration (8hrs)**

  Fundamentals-Operators- Conditionals-Loops

MTH16A4	COURSE NAME TENSOR &NUMERICAL METHODS	CATEGORY	L	T	P	CREDIT
		THEORY	45	-	-	5

Preamble

- To present students the elements of tensoranalysis.
- To introduce different methods for solving problemsnumerically.
- To enable the students to find solution to practical and real world problem using numerical methods.

Mapping with Course Outcomes

Upon the successful completion of the course, students will be to

CLO Number	CLO Statement	Knowledge Level
CLO1	Describe the basic concepts of tensor analysis and its application in science and engineering.	K2
CLO2	Demonstrate the theoretical and practical aspects of numerical methods.	K3
CLO3	Implement numerical methods for a variety of multidisciplinary applications.	K4
CLO4	Understand the different numerical methods for interpolation, differentiation, integration and solving set of ordinary differential equations	K5
CLO5	Implement numerical methods in various physical problems.	K6

Mapping with Programme Outcomes

CLO2.	S	S	S	M
CLO3.	S	S	S	M
CLO4.	S	S	S	S
CLO5.	S	S	M	S

S- Strong; M-Medium; L-Lo

Syllabus

Unit I **(8 Hrs)**

Tensor Analysis Definition of Tensors - Contravariant - covariant and mixed tensors - addition and subtraction of Tensors - Summation convention - Symmetry and Anisymmmetry Tensor - Contraction and direct product - Quotientlaw.

Unit II **(8Hrs)**

Numerical solutions of Algebraic and Transcendental Equation: Method of False position (RegulaFalsi method) -Newton -Raphson Method -Solution of Simultaneous Linear Algebraic Equations: Gauss Elimination Method - Interpolation with equal intervals: Gregory -Newton's forward interpolation formula for Equal Intervals - Gregory -Newton's Backward interpolation formula for Equal Intervals - Interpolation with unequal Intervals: Lagrange's Interpolation Formula for unequal Intervals - Method of Least Squares: Fitting a straight line - Fitting a Second Degree Parabola.

Unit III **(8 Hrs)**

Numerical Differentiation: Values of the derivatives of y - based on Newton's Forward Interpolation formula - Values of the derivatives of y - based on Newton's Backward Interpolation formula.

Unit IV **(8 Hrs)**

Numerical integration: Newton -Cote's Quadrature Formula - Trapezoidal rule - composite trapezoidal rule - Simpson's one - third rule - composites Simpson's one - third rule - Simpson's three - eighths rule - composite Simpson's three eights rule.

Unit V **(8 Hrs)**

Numerical solutions of ordinary differential equations: Euler's method - Runge -Kutta formulas of first and second order - Runge - Kutta formulas of the third and fourth order - RungeKutta formula for the solution of second order differentialequation.

MPS2311	CONDENSED MATTER PHYSICS I	Category	L	T	P	Credit
			58	2	-	5

Preamble

The objective of introducing this paper is to provide an in-depth knowledge of crystal structure, properties of crystals, superconductivity and different dielectric related properties.

Prerequisite

Quantum Mechanics

An undergraduate level course in solid state physics

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand the fundamentals of crystal structure, vibrational and electrical properties	**K2**
CLO2	Apply reciprocal lattice to the crystal structure and explain how it gives rise to band structure and Brillouin zone. Apply quantum mechanics for theoretical and numerical calculations	**K3**
CLO3	Analyse the microscopic structure of the material and how it is mirrored in macroscopic aspect	**K4**
CLO4	Evaluate the structure of materials by crystal structure and band theory	**K5**
CLO5	Create an ability to identify relevant principles, mathematical techniques and laws when dealing with problems in condensed matter physics	**K6**

Mapping with Programme Outcomes

CLO4	S	S	S	M	M	L	M
CLO5	S	M	S	M	S	L	M

S- Strong; M-Medium; L-Low

Syllabus

Unit I : Crystal structures **12 hrs**

Introduction- lattice points and space lattice-basis and crystal structure – **unit cells and lattice parameters - unit cells versus primitive cell- crystal systems – crystal symmetry**[1] – the twenty three symmetry elements in cubic crystal-to show that five-fold rotation axis is not compatible with a lattice – combination of symmetry elements- Rotation-Inversion axis – translation symmetry elements – Space groups – **Bravais space lattice**[1,2]**- Directions, planes and miller indices**[3]-important planes and directions in a cubic crystal-**allotropy and polymorphism**[4]**.**

Unit II: X-ray crystallography and defects in solids **11 hrs**

Reciprocal Lattice- Graphical demonstration of the Reciprocal Lattice-Vector algebraic discussion of Reciprocal Lattice-Spacing of planes of crystal lattice-**relation between crystal lattice axes and crystal Reciprocal Lattice axes**[5]-Brillouin zones-Brillouin zone for simple cubic lattice,bcc lattice, fcc lattice- Reciprocal Lattice to bcc lattice- Reciprocal Lattice to fcc lattice-X-ray diffraction-Bragg's law-**Crystal imperfections - Point defects-Vacancies-Interstitialcies**[6]**-Schottky defects and Frenkel defects**[7]-Line imperfections-Edge dislocation-**Screw dislocation**[8,9]-Burgers Vector .

Unit III :Lattice vibrations and thermal properties **12 hrs**

The concept of the lattice mode of vibration[10]**-Elastic vibrations of continuous media- Phase velocity-group velocity**[11]-Vibrations of one dimensional monatomic linear lattice- Vibrations of one dimensional diatomic linear lattice-The concept of phonons-Momentum of phonons-Inelastic scattering of photons by phonons- Inelastic scattering of X-rays by phonons- Inelastic scattering of neutrons by phonons-**Specific heat-Einstein's theory of Specific heat**-Debye's theory-Debye's approximation-Thermal conductivity.

Unit IV: Free Electron Fermi Gas **12 hrs**

Classical free electron theory of metals- Drawbacks of classical theory[12] **– Quantum theory of free electrons**[13]**-Free particle- tunnel effect**[14]**-** Particle in a box (one dimensional)- three dimension box - density of states-Hall effect- Fermi – Dirac distribution function- heat capacity of electron gas- effect of temperature on Fermi Dirac function- electrical conductivity from quantum mechanical consideration.

Unit V: Band Theory **11 hrs**

Failure of Sommerfeld's free electron theory-Band theory of solids[15]-Kronig - Penney model-construction of one, two and three dimensional Brillouin zones - Extended, Reduced and Periodic zone schemes – Number of possible wave function in a band-motion of electron in one dimensional periodic potential- Effective mass of an electron - **Distinction between metals, semiconductors, and insulators using band theory**[16]**.**

Preamble

The aim of this course is to build a strong base on the advanced concepts in quantum mechanics and to make students understand the methods that are required for the accurate description of various microscopic systems.

Prerequisite

12. Basics of time dependent and Independent Perturbation theories
13. Ideas on quantum field theory and relativistic wave equation

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand the concepts of perturbation theory and approximation methods; and the set of mathematical tools needed to formulate problems in quantum mechanics.	K2
CLO2	Solve problems in and on systems of identical particles, e.g. determine the symmetry properties of the wave function, and the total spin.	K3
CLO3	Establishing the relations and validating various results. Comparing the properties of various quantities, methods and so on. Give concise physical interpretations, and arguments for the validity of the methods.	K4
CLO4	Integrate several components of the course like quantum states, symmetries in the context of finding solution to the problems in molecular and elementary particle physics	K5
CLO5	Present the methodologies, language and conventions of quantum mechanics from this course to prove and test ideas and explanations on various problems involving various systems of particles	K6

Syllabus

Unit I: Time Dependent Perturbation Theory **11 hrs** Time Dependent Perturbation Theory- Introduction-First Order perturbation- Harmonic perturbation-Transitions to continuum states- Fermi's Golden rule-Transition Probability-**Selection Rules for Dipole Radiation[1,2,3]**-Adiabatic Approximation-**Sudden approximation[4].**

Unit II: Scattering Theory **12 hrs**

Scattering cross section - Scattering amplitude -**Laboratory and centre of mass coordinate systems[5]** – Partial waves - Phase Shifts - Scattering by Coulomb and**Yukawa potential[6]**– Born approximation -Validity of Born approximation.

Unit III: Theory of Radiation (Semi Classical Treatment) **11hrs**

Laser Theory - Einstein's Coefficients - Spontaneous and Induced Emission of Radiation from Semi Classical Theory[7,8]-Radiation Field as an Assembly of Oscillators-Interaction with Atoms-Emission and Absorption Rates-Density Matrix and its Applications.

Unit IV: Elements of field quantization **12 hrs**

Quantization of the Wave Fields –**Quantization of Lagrangian[9]**and Hamiltonian equation-Quantization of the Non-relativistic Schrodinger equation-**Number operators- Creation and Destruction–Anti Commutation Relations[10]**-Quantization of the electromagnetic field (Energy and Momentum).

Unit V: Relativistic Quantum Mechanics **12 hrs**

Klein Gordon Equation- Interpretation of the Klein Gordon Equation-Charge and Current Density-**Application to the Study if Hydrogen like atom[11]-Dirac's relativistic equation for a free particle[12]**-Dirac matrices-Dirac's equation in Electromagnetic Field-Negative energy states.

MPS2313	ATOMIC AND MOLECULAR SPECTROSCOPY	Category	L	T	P	Credit
			58	2	-	5

Preamble

To develop the relevant knowledge of analytical tools to elucidate the various kinds of molecular structure and understand the instrumental aspects of specific spectroscopic techniques

Prerequisite

- Basic principles on spectroscopy, Quantum and classical mechanics

Course Learning Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Attain basic knowledge about the interactions of electromagnetic radiation and matter and their applications in spectroscopy	K2
CLO2	Identify the specific and suitable molecular spectroscopy methods for solving given scientific problem	K3
CLO3	Apply formalisms based on molecular symmetry to predict spectroscopic properties	K4
CLO4	Examine and analyze spectroscopic data collected by various analytical methods discussed in the course.	K5
CLO5	Solve problems related to the structure, purity and concentration of chemicals and to study molecular interactions by choosing suitable spectroscopic methods	K6

S- Strong; M-Medium; L-Low

Unit I: Atomic & Microwave Spectroscopy 11hrs

Quantum states of an electron in an atom

Interaction of light with matter - Spectra of Alkali Metal Vapours-*Normal Zeeman Effect-Anomalous Zeeman Effect*-Magnetic Moment of Atom and the G Factor - Lande's 'g' Formula - Paschen Back Effect-Hyperfine Structure of Spectral Lines.

Microwave Spectroscopy: The Rotation of molecules- Rotational spectra- Diatomic molecules- poly atomic molecules-**Techniques and Instrumentation- Chemical analysis by Microwave Spectroscopy[1].**

Unit II: Infrared & Raman Spectroscopy 12hrs

Infra-red spectroscopy:

The Vibrating Diatomic molecule- the diatomic vibrating rotator- the vibration-rotation spectrum of Carbon Monoxide- breakdown of the Born-Oppenheimer Approximation: the interaction of rotation and vibrations-**The vibrations of Polyatomic molecule[2,3,4]-** Techniques and Instrumentation.

Raman Spectroscopy:

* Introduction- Pure rotational Raman Spectra*- Vibrational Raman Spectra- Polarization of Light and the Raman Effect- **Structure Determination from Raman and Infra-red spectroscopy- techniques and Instrumentation[2,3,4].**

Unit III: Electronic Spectra: Fluorescence & Phosphorescence Spectroscopy 12hrs

Electronic Excitation of Diatomic Species-Vibrational Analysis of Band Systems of Diatomic Molecules- Deslandres Table-Intensity Distribution- Franck Condon Principle-Rotational Structure of Electronic Bands-Resonance and Normal Fluorescence-Intensities of Transitions-Phosphorescence Population of Triplet State and Intensity-**Experimental Methods-Applications of Fluorescence and Phosphorescence[5,6,7].**

Unit IV: NMR & NQR Spectroscopy 12 hrs

NMR Spectroscopy: Quantum Mechanical and Classical Description-Bloch Equation-Relaxation Processes-Experimental Technique-Principle and Working of High Resolution NMR Spectrometer-**Chemical Shift- NMR Imaging- Interpretation of certain NMR spectra (Ethanol, 1 – Nitropropane, methyl ethyl ketone)[8].**

NQR Spectroscopy: Fundamental Requirements-basic Principle - Half integral spins- Experimental Detection of NQR Frequencies-Determination of molecular structure.

Unit V: ESR & Mossbauer Spectroscopy 11hrs

ESR Spectroscopy: Basic Principles Theory of ESR-Resonance conditions--**Experiments-ESR Spectrometer-Applications[9,10]-** ESR Spectrum-Crystalline solids and free radicals in liquids- Hyperfine Structure

Mossbauer Spectroscopy: Mossbauer Effect-Recoilless Emission and Absorption-

Mossbauer Spectrum-Experimental Methods[11]- Hyperfine Interaction-Chemical Isomer Shift-Magnetic Hyperfine and Electric Quadrupole Interaction

MPS2314	ADVANCED MICROPROCESSOR AND MICROCONTROLLER	Category	L	T	P	Credit
			58	2	-	5

Preamble

To make the students aware of the development of advanced microprocessors and microcontrollers and give them training in writing program in assembly language of 8085.

Prerequisite

1. Basic idea on assembly language

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understanding the basic concepts of architecture and assembly language programming of 8085 microprocessor and microcontroller	K2
CLO2	Apply the acquired knowledge in the mnemonics of 8085 to write microprocessor programs	K3
CLO3	Analyze the interfacing concepts and explaining the memory and addressing modes	K4
CLO4	Write a assembly language program with 8085 & 8051	K5
CLO5	Create a program with interfacing conceptsof real world input and output	K6

Mapping with Programme Outcomes

Syllabus

UnitI:Microprocessor Architecture and Instruction set 12hrs

8 bit Microprocessor -8085 microprocessor architectures–8085 pin description-Microprocessor – Communications and Bustimings–**ControlSignals**[1] –**Example of an 8085 based Microcomputer** [2,3]**–** Instructionset**– Data transfer Operations**[4]**– Arithmetic Operations** [5] **- Logical Operations** [6] **– Branch Operations** [7]**–** Instruction format

UnitII: Software Programs (using 8085) 11hrs

Addition – Subtraction – Multiplication – Division – BCD Arithmetic – Choosing the biggest andsmallest numbers from a list – Time delays – **Illustrative Programs- Hexadecimal counter**[8] **– Squarewave generator**[9]

UnitIII: 16& 32BitMicroprocessors 12hrs

16bit Microprocessors–Inte l8086-pin description for minimum mode pin description for maximum mode–Internal Architecture–programming model–**memory segmentation**[10]– **Instructionset**[11]–**Coprocessing** [12]**–Memoryinterfacing–I/Ointerfacing**[14]**–Intel 80186** [15]**and 80286-32bit Microprocessors – Intel 80386/80486 – Intel Pentium processor** [16]

UnitIV: Interfacing memory and I/O devices 12hrs

Basic Interfacing concepts–Memory-MappedI/O–Programmable Peripheral Interface(8255A) – 8254Programmable Interval timer – DMA Controller – **8259A Programmable Interrupt Controller.**[17,18]

UnitV:8051Microcontroller 11hrs

Architecture–Microcontroller8051 data memory hardware programs and–**External memory**[19]**– counters** [20, 21]**–** serial data I/O **– interrupts.**[22]

MPS19S1	RESEARCH METHODOLOGY	Category	L	T	P	Credit
			28	2	-	3

Preamble

This paper aims to develop the skills of students in doing research and compiling their results in an effective manner.

Prerequisite

16. Idea on ordinary and partial Differential equations
17. Basic programming

Course Learning Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand the basic principles and carry the knowledge forward which can be applied in different areas of research.	K2
CLO2	Emphasize on the analytical methods and their computational implementation using calculations of software such as Matlab	K3
CLO 3	Develop skills on problem solving using various mathematical tools.	K4
CLO 4	Expose the students to the use of mathematics which they can applying contemporary Physics research.	K5
CLO5	Get a clear idea on the basic numerical methods and the ways to evaluate the accuracy and effectiveness of the research findings.	K6

Syllabus

UnitI:High Performance Computing using Matlab **5Hrs**

Matlab:

Introduction - **Matrices and vectors- Matrix and Array Operations**[1]- Creating and using INLINE functions- using built in- functions and on-line help- *saving and loading data* - Script files-function files.

UnitII:Data Analysis: **6Hrs**

Introduction - Measures of central value- mean, median, mode, geometric mean andharmonicmean[2,3],Karl Pearson coefficient of skewness and correlation,Rank orrelation coefficient,Regression analysis,difference between correlation and regression.

UnitIII:Ordinary DifferentialEquations: **6Hrs**

Power series approximations – Taylor series – Taylor series method for simultaneous firstorder differential equations – Taylor series method for second order differential equation- **Euler'smethod– Improvedand ModifiedEuler method**[4]-Milne'sPredictor–Corrector method.

UnitIV:PartialDifferentialEquations: **6Hrs**

Difference quotients – **Graphical representation of Partial quotients – Classification of PDE of the second order**[5,6,7] – Elliptic equations – Standard five point formula – Diagonal five-point formula– Solution of Laplace's equation by Liebmann's iteration

UnitV:ResearchEthicsandResponsible ConductinResearch **6Hrs**

Brief history and analytical basis of research ethics, responsible conduct in research (Honesty inScience:Integrity,Authorship,ConflictsofInterest,Privacy and Confidentiality,Informed Consent, Risk/Benefit Assessment), **The legal regulation of research ethics in India (From UGC,MHRDandothergoverningagencies),Regulatoryrequirementsrelevanttointernationalresearch**[8,9]**.**

MPS23P3	PRACTICAL III - ADVANCED PRACTICALS	Category	L	T	P	Credit
			-	-	5	4

Preamble

The aim of this course is to make the students have hands on training in doing experiments in Optics and Electricity and Magnetism.

Prerequisite

1. Experience in calibrating and handling instruments

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CO Statement	Knowldge Level
CLO 1	Understand the basics of experimental physics	K2
CLO 2	Explore the concepts involved in the thermodynamics, heat and modern optics	K3
CLO 3	Inculcate strong laboratory skills	K4
CLO 4	Enhance the present day requirements in industries, research fields.,	K5
CLO 5	Create the knowledge of theories involved in physics using practical experiments	K6

Mapping with Programme Outcomes

S- Strong; M-Medium; L-Low

PRACTICAL III - General

(Examination at the end of Second Semester)

Any Twelve Experiments

1. Determination of g factor – ESR spectrometer
2. (i) Identification of prominent lines – Fe arc

   (ii) Identification of prominent lines – Brass arc
3. Absorption spectrum-$KMnO_4$
4. Michelson Interferometer
5. Susceptibility of a given solid by Guoy method
6. Susceptibility of a given liquid by Quincke's Method
6. Compressibility of a Liquid-Ultrasonic Method
7. Variation of Hall Effect with temperature
8. Thickness of a film- Ellipsometer
9. Faraday effect apparatus-Determination of Verdet's Constant
10. Diffraction of light by (i) Single slit (ii) Double slit (iii) Transmission grating

    (iv) Single wire (v) Cross wire (vi) Wire mesh
11. Determination of dielectric constant of a substance
12. Resistivity by Four-probe method and band gap of semiconductor
13. Kelvin's Double Bridge-Determination of Very Low Resistance & Temperature

    Coefficient of Resistance.
14. Analysis of X-ray diffraction pattern
15. Study of FTIR spectrum and TGA

Course Designers:

1. Dr.M.Lavanya

MPS23P4	PRACTICAL IV – SPECIAL ELECTRONICS	Category	L	T	P	Credit
			-	-	5	4

Preamble

The aim of this course is to make the students practically learn the applications of the Op amp, IC 555 Timer and Microprocessors and to study the functioning of A/D Converters, D/A Converters and Microprocessor.

Prerequisite

Skill in constructing electronic circuits

Course Outcomes

CLO Number	CO Statement	Knowledge Level
CLO 1	To make the student understand the basic concepts in IC's, digital devices and Microprocessor	K2
CLO 2	Various applications of electronic devices and circuit systems	K3
CLO 3	Inculcate strong laboratory skills	K4
CLO 4	Enhance the present day requirements in industries, research fields.	K5
CLO 5	To produce electronic professionals who can be directly employed or start his/her own work as Electronic circuit Designer	K6

On the successful completion of the course, students will be able to

CLO 5	S	M	S	M	M	S	M

S- Strong; M-Medium; L-Low

PRACTICAL IV - ELECTRONICS

(Examination at the end of Second Semester)

Any Twelve Experiments

1. Op-Amp: Simultaneous Addition & Subtraction
2. Op-Amp: Instrumentation Amplifier-Light Intensity-Inverse Square Law
3. Op-Amp: (i) V to I & I to V Converter
4. Op-Amp: Analog Computation-First Order Differential Equation
5. Op-Amp Comparator-Zero Crossing Detector, Window Detector, Time Marker
6. IC 555 Timer Application- Monostable&Astablemultivibrator, voltage controlled oscillator
7. A/D Converters-Any One Method
8. D/A Converters-Binary Weighted & Ladder Methods
9. IC Counters with Feedback
10. Microprocessor: LED Interfacing
11. Microprocessor: Stepper Motor Interfacing
12. Microprocessor: ADC Interface-Wave Form Generation
13. Microcontroller: Blinking of LEDs either 8051 or 16F84
14. Microcontroller: Controlling LED with switch.
15. Microcontroller: DC motor control.
16. Microcontroller: triangle wave generator-Using 8085 Simulator
17. Write an assembly language program to perform
    (i) simple arithmetic operations – addition, subtraction, multiplication and division.
    (ii)increment and decrement
18. Write an assembly language program to arrange the given set of numbers in
(i) ascending and descending order
(ii) Maximum and minimum of numbers.
19. Write an assembly language program to perform (i) Binary to BCD conversion
(ii)BCD to Binary conversion.

13. Op amp – Integrator, differentiator, Time marker

Course Designers:

- Dr.J.Balavijayalakshmi

MPS2310	LASER PHYSICS	Category	L	T	P	Credits
			58	2		4

Preamble

The main objective of this course is to provide a wide knowledge about the Fundamentals of lasers, characteristics, types of laser beams and applications.

Prerequisite

- Basic knowledge of Optics, Electromagnetism and Quantum mechanics

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand and explain the principles and design considerations of various lasers, modes of their operation and areas of their application.	K2
CLO2	Apply skills in applying the basics of Gaussian beam and solve numericals using ABCD law.	K3
CLO3	Analyse laser devices, its characteristics at a quantitative level.	K4
CLO4	Evaluate problems at higher order levels.	K5
CLO5	Innovate and design new types of laser beams for commercial applications.	K6

Mapping with Programme Outcomes

CLOs	PLO1	PLO2	PLO3	PLO4	PLO5	PLO6	PLO7

CLO5	S	S	S	S	S	S	M

S- Strong; M-Medium; L-Low

Syllabus

Unit –I **11 Hrs**

Lasers: Fundamentals and Types

Basic Construction and Principle of Lasing- ***Einstein Relations and Gain Coefficient**[1,2] - Creation of a Population Inversion*- Three-Level System - Four-Level System -Threshold Gain Coefficient for Lasing- Laser types-He-Ne Laser-CO_2 Laser- Nd:YAG Laser- Semiconductor

Laser

Unit – II **12 Hrs**

Laser Operation

Optical Resonator- **Laser Modes- Axial modes- Transverse modes[3,4]**- Modification in Basic Laser Structure- Basic Principle of Mode Locking- Active Mode Locking -Passive Mode Locking- Q Switching- Pulse Shaping-application of lasers in SMILE surgery

Unit – III **11 Hrs**

Laser Beam Characteristics

Introduction to Gaussian Beam-**width-Divergence-Radius of Curvature-Rayleigh Range-Guoy Phase[5]** –formulation of ABCD matrix method –ABCD matrix of some optical system-ABCD Law for Gaussian Beam-The Complex Radius of Curvature

Unit – IV **12 Hrs**

Focusing of laser beam

Diffraction- limited spot size-tight focusing of light angular spectrum representation of optical near field-aplanatic lens-Focusing of higher-order laser modes-Radially polarized doughnut mode-Azimuthally polarized doughnut mode-applications-applications-near field optical recording-**optical tweezers[6,7]- STED microscopy[8,9]**

Unit – V **12 Hrs**

Surface Plasmons

Introduction-Optical properties of noble metals- **Drude–Sommerfeld theory**- Surface Plasmon polaritons at plane interfaces- Properties of surface plasmon polaritons- Excitation of surface plasmon polaritons- **Surface plasmon sensors[10]**.

MPS2316	NUCLEAR AND PARTICLE PHYSICS	Category	L	T	P	Credits
			73	2	-	4

Preamble

The objective of introducing this paper is to provide an in-depth knowledge of nuclear structure, nuclear models, nuclear reactions and different elementary particles.

Prerequisite

- Basic idea on nuclear models, elementary particles

Course Outcomes

On the successful completion of the course, students will be able to

CLO. Number	CLO Statement	Knowledge Level
CLO1.	Understand the concepts in nuclear and particle physics	K2
CLO2.	Applying conservation principles to determine the type of reaction taking place and the possible product outcome	K3
CLO3.	Analyze the properties of stable nucleus and explore different types of nuclear models	K4
CLO4.	Expand and evaluate the theoretical predictions for nuclear reactions.	K5
CLO5.	Acquire quantum mechanical reasoning in classification of particles in subatomic level.	K6

Mapping with Programme Outcomes

S- Strong; M-Medium; L-Low

Syllabus

Unit I : Nuclear Disintegration Studies **15 Hrs**

Alpha Decay: **Properties of Alpha particles**[1] - velocity and energy of alpha particles- Geiger Nuttal Law – Gamow's theory of alpha decay.

Beta Decay: **Properties of Beta particles**[1]-Fermi theory of beta decay- **Curie plot**[3]- Forms of

interaction and selection rules-electron capture
Gamma Transitions: **absorption of Gamma rays by matter[2]-** interaction of Gamma rays with matter – the measurement of Gamma ray energies- Dumond bent crystal spectrometer- internal conversion.

Unit II: Elements of Nuclear Structure and Systematics **15 Hrs**
Theories of Nuclear composition (Proton electron theory) –**Mass Spectroscopy[4]- Bainbridge and Jordan mass spectrograph[5]** – Nier's mass spectrometer – Deuteron – magnetic and quadrupole moment of deuteron – ground state of deuteron – excited state of deuteron – the **meson theory of nuclear forces – Yukawa potential[6].**

Unit III: Properties of Stable Nucleus and Nuclei Models **14 Hrs**
Semi-empirical mass formula – Nuclear models- **liquid drop model, Semi empirical mass formula[7]**, **Shell models[8,9]** – Magic numbers – Single particle method- **Collective model[8]**- magnetic moments and shell model- prediction of angular moments of nuclear grounds state.

Unit IV: Nuclear Reaction Studies **14 Hrs**
Conservation laws for nuclear reactions- Nuclear Energy – Reaction dynamics- Q equation- **Breit Wigner one level dispersion formula[10]-** Photonuclear reaction – fission process – cross sections – **Bohr Wheeler theory[11]**.

Unit V: Elementary Particles **15 Hrs**
Classification of elementary particles[12] – Fundamental interaction – Electromagnetic, strong , weak and gravitational interactions – Parameters of elementary particles – Conservation laws – **CPT theorem – Okubo mass formula for SU (3) symmetry[13]** – Quarks theory- Unification theory-**Standard Model[14]** - Higgs Bosons (Elementary ideas).

MPS2317	CONDENSED MATTER PHYSICS- II	Category	L	T	P	Credits
			73	2	-	4

Preamble

This course deals with the crystal growth techniques, Super conductivity, electrical and magnetic properties of materials.

Prerequisite

- Basic Knowledge on crystal structure and introductory quantum mechanics and classical mechanics

Course Outcomes

On the successful completion of the course, students will be able to

CLO Number	CLO Statement	Knowledge Level
CLO1	Understand the concepts in nuclear and particle physics	K2
CLO2	Applying conservation principles to determine the type of reaction taking place and the possible product outcome	K3
CLO3	Analyze the properties of stable nucleus and explore different types of nuclear models	K4
CLO4	Expand and evaluate the theoretical predictions for nuclear reactions.	K5
CLO5	Acquire quantum mechanical reasoning in classification of particles in subatomic level.	K6

CLO5	S	S	S	S	S	S	M

S- Strong; M-Medium; L-Low

Syllabus

Unit I : Crystal growth phenomena **14 Hrs**

Introduction-nucleation-Theories of nucleation-Classical theory of nucleation- -Gibbs Thomson equation-Energy of formation of a nucleus-spherical nucleus-cylindrical nucleus-heterogeneous nucleation- crystal growth from melt-Bridgeman technique- Container selection-

Crystal pulling-*Czochralski technique*-zone melting technique-low temperature solution growth-crystal growth system-vapour growth-physical vapor deposition-chemical vapor deposition-**The technology of epitaxy-liquid phase epitaxy-vapour phase epitaxy**[1].

Unit II: Super Conductivity **15Hrs**

Mechanism of super conductivity-Effect of magnetic fields – AC Resistivity-Critical currents-Meissner effect- Thermal properties--Energy gap-Isotope effect-The penetration depth - Type I and Type II superconductors- London equation-superconductors in AC fields-**thermodynamic of superconductors**[2]- A survey of BCS theory- BCS theory of superconductivity –Quantum tunnelling- Josephson superconductor tunnelling – DC Josephson effect – AC Josephson effect - Macroscopic Quantum interference

Unit III: Dielectrics and Ferroelectrics **15 Hrs**

Maxwells equation – Polarization –Macroscopic Electric field : depolarization electric field – Local electric field in an atom – Lorentz field –field of dipoles inside a cavity – dielectric constant and polaizability: Electric polarizability – structural phase transtition – **Ferro electric crystals**[3] – classification of ferroelectrics crystal – Displacive Transition :soft optical phonon – London theory of the phase transition: soft optical phonon – London theory of the phase transition – second order transition – first order transition – **antiferro electricity and ferro electric domains –Piezo electricity**[4] – ferro elasticity.

Unit IV: Diamagnetism and Paramagnetism **14 Hrs**

Langevin diamagnetism equation –**quantum theory of diamagnetism of mono nuclear systems**[5] – Paramagnetism – quantum theory of paramagnetism: rare earth ions – Hund rule – Iron group ions – Crystal field splitting – Quenching of the orbital angular momentum – spectroscopic splitting factor - Van Vleck temperature – independent Paramagnetism cooling by isotropic demagnetization – Paramagnetic susceptibility of conduction electron.

Unit V : Ferromagnetic Order **15 Hrs**

Currie point and exchange integral – temperature dependence of the saturation magnetization – saturation magnetization at absolute zero - Magnons: **Quantization of spin waves thermal excitation of magnons**[6] – Neutron Magnetic scattering – Ferri magnetic orders: Curie temperature and susceptibility of ferrimagnetisms – iron garnets – Anti ferromagnetic order: susceptibility below the Neel temperature – anti ferromagnetic magnons – Ferromagnetic domains: an isotropic energy– transition region between domains

ADVANCED LEARNERS' COURSE -I
COMMUNICATION SYSTEMS

Subject Code: MPS16AC1
Credits: 5

Objective:
The aim of this course is to acquire knowledge about different modulations and various communication systems.

Unit I: **Amplitude Modulation**
Introduction-Amplitude modulation- Amplitude modulation index-Modulation index for sinusoidal AM-Frequency spectrum for sinusoidal AM-Average power for sinusoidal AM-Effective voltage and current for sinusoidal AM – Double sideband suppressed carrier(DSBSC) modulation- Amplitude modulator circuits- Amplitude demodulator circuits.
Single sideband principles- Balanced modulators- SSB generation-SSB reception- Modified SSB systems- Signal to noise ratio for SSB - Companded SSB.

Unit II: Angle Modulation
Introduction – Frequency modulation – Sinusoidal FM- Frequency spectrum for sinusoidal FM-Average power for sinusoidal FM- Modulation index for sinusoidal FM- Phase modulation- Equivalence between PM and FM – Sinusoidal PM- Digital PM- Angle modulator circuits- FM Transmitters- Angle modulation detectors.

Unit III: **Pulse and Digital Modulation**
Pulse amplitude modulation (PAM)- Pulse code modulation(PCM)- Pulse frequency modulation(PFM)- Pulse time modulation (PTM)- Pulse position modulation (PPM)-Pulse width modulation(PWM)
Digital communication- Introduction- Synchronization -Asynchronous transmission-Probability of Bit error in baseband transmission –Digital carrier systems.

Unit IV:**Satellite and Fibre Optic Communications**
Kepler's first law- Kepler's second law- Orbits- Geostationary orbits- Power systems- Altitude control- Satellite station keeping- Antenna look angles- Limits of visibility- Frequency plans and polarization- Transponders –Multiple access methods.
Fibre optic communications introduction-Light sources for fibre optics- Photodetectors-Connectors and Splices- Fibre optic communication link.

Unit V: Antennas And Microwave Tubes
Basic considerations – Wire radiators in space- Terms and definitions- Effects of ground on antennas- antenna coupling at medium frequencies- Directional high frequency antennas-Microwave antennas- Wideband and special- purpose antennas. Multicavity Klytstron- Reflex Klystron- Magnetron- Travelling-wave tube.
